immunotherapy of HIV induced disease. They are useful as neutralising field isolates and provide useful information regarding the immunocompetence of an immune response in HIV infected patients. The monoclonal antibodies are useful for producing anti-idiotypic antibodies which can be used to screen human monoclonal antibodies to identify whether the antibody has the same binding specificity as the antibodies of the invention. The neutralising antibodies define new epitopes on the HIV gpl20 and gp41 glycoproteins, thus increasing the availability of new immunotherapeutic human monoclonal antibodies derives from the fact that they are encoded by a human polyuncleotides sequence. Thus in vivo use of the monoclonal antibodies derives from the fact that they are encoded by a human polyuncleotides sequence. Thus in vivo use of the monoclonal antibodies of significant host immune response to the passively administered antibodies of kenogeneic or chimeric derivation are utilized. An additional major advantage of the monoclonal antibodies described derives from the fact that they immunoreact with a unique determinant present on mature HIV glycoprotein gpl20. This class of antibodies is particularly effective at neutralising field isolates of HIV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

The present invention describes a hybrid polypeptide (I) comprising: (a) a polypeptide motif containing a sufficient number of contiguous amino addressives from a polypeptide associated with a disease of protein aggregation or conformation to bind an aggregating form of the polypeptide or to a disease-associate conformer of the polypeptide or to a disease-associate conformer of the polypeptide or to a disease-associate conformer of the polypeptide or to a disease-associate conformer of the polypeptide or to a disease-associate conformer of the polypeptide or to a disease causing or infectious conformer of the polypeptide that is the source of the polypeptide motif compared to a benign form of the polypeptide. Also described: (1) a nucleic acid molecule encoding (1); (2) a vector comprising the nucleic acid molecule encoding (1); (3) a vector comprising the nucleic acid molecule; (3) a cell comprising the vector; (4) detecting enclored or a PrESC form of a prion polypeptide or sample; (5) a solid support comprising a plurality of polypeptides described with a disease of protein aggregation; (7) preparing a hybrid molecule with a disease of protein aggregation; (7) preparing a protein involved in the disease mentioned above; and (8) an anti-idiotype antibody that specifically binds to an infectious form of a prion protein. (1) has neuroprotective, notropic, antidiabetic, antidiotype antibody that correspondence antiparkinsonian, cytostatic, nephrotropic, cardiant, antidiammacory and antiarterioscleratic activities, and can be used in care therapy. The composition and methods of the present invention can be used in diagnosing or treating diseases of protein aggregation or conformation, such as Creutzfeldt-dakob disease, scrapie and bovine spondiated with chronic inflammacory disease, immunoglobulin ampliantery herefit encoded with chronic inflammacory disease, immunoglobulin and methods of protein aggregation or spondiated with chronic inflammacory disease, immunoglobulin appresent inventive protein conformation, 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  transthyretin gene, amyotrophic lateral sclerosis, Pick's disease, Parkinson's disease, Frontotemporal dementia, multiple myeloma, plasma cell dyscrasias, familial amyloidotic polymeuropathy, medullary carcinoma of thyroid, chronic renal failure, congestive heart failure, senile cardiac and systemic amyloidosis. Chronic inflammation, atherosclerosis or familial amyloidosis. The present sequence is used in the exemplification of the present invention.
                                                                                                                                                                        New motif-grafted hybrid polypeptides binding to the infectious form of a
prior, useful for diagnosing or treating diseases of protein aggregation
or conformation, e.g. amyloidosis, Alzheimer's disease, renal failure or
diabetes.

ò The invention relates to a recombinant adeno-associated virus (rAAV) / Igilbl2 or rAAV(ScFvX5 genome. The rAAV is useful for gene delivery, particularly in delivering antibody genes to target cells in mammals. The antibodies may be used to prevent and/or treat viral infections (particularly HIV), bacterial infections and other chronic disease states (e.g. cancer, rehumatoid arthritis, inflammation, fatal familial insomnia, kuru, Mad Cow Disease or Alpers Syndrome). The present sequence represents the human monoclonal antibody (MAb) IgGlb12 heavy chain 120 61 GQRFBWMGWINPYNGNKEFSAKFQDRVTFTADTSANTAYMBLRSLRSADTAVYYCARVGP 120 9 1 MEWSWVFLFFLSVTTGVHSQVQLVQSGAEVKKPGASVKVSCQASGYRFSNFVIHWVRQAP 61 GORFEWMGWINPYNGNKEFSAKFODRVTFTADTSANTAYMELRSLRSADTAVYYCARVGP MEWSWVFLFFLSVTTGVHSQVQLVQSGAEVKKPGASVKVSCQASGYRFSNFVIHWVRQAP 0; Gaps Query Match 100.0%; Score 793; DB 7; Length 476; Best Local Similarity 100.0%; Pred. Lymphocyte mRNA was converted to CDNA and subjected to PCR amplification using primers specific for heavy and light chain variable regions. The amplification products were inserted into a dicistronic vector to produce a library of fragments. E.coli XLI Blue cells were transformed with the library. Filamentous phage were produced which expressed the MAb regions on their surface. Panning with gpl20 and gp41 resulted in the recovery of immunoreactive clones. The heavy chain VH region sequence AARA4244 neutralises HIV1 gpl20. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           9
                                                                                                                                                                                                                                                                                                                                            New human monoclonal antibodies neutralising HIV - react with gp120 or gp41 and nucleic acid encoding them, useful for in vivo or in vitro diagnosis and for passive immuno-therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         1 LEQSGAEVKKPGASVKVSCQASGYRFSNFVIHWVRQAPGQRFEWMGWINPYNGNKEFSAK

                                                                                                                                                                                                                                                                                                                                                      The sequences given in AAR75568-72 represent human Fab's comprising variable chain heavy regions (VH), which bind to HIV gp120. The Fab's 3b1, 3b3, 3b4 and 3b9 have the same amino acid composition as MT4 but have randomised amino acids in the entire CDR1 and in four of the 18 amino acid residues in CDR3. These Fab's are used in the production of a human monoclonal antibody (MAb) which is capable of immunoreacting with, and neutralising HIV. The MAb's are capable of reducing HIV infectivity titre in an in vitro virus infectivity assay by 50% at a concentration of fallong of antibody per ml. They can be used to provide passive fimmunotherapy to HIV in a human. They can be thy more effectively than antibodies selected from non-randomised combinatorial libraries
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       82
                                                                                                                     Synthetic human neutralising monoclonal antibodies to human immunodeficiency virus - used for diagnosis and immuno:therapy of HIV-

This sequence represents the sequence of clones b4 and b12. The MAD has the capacity to reduce HTV infectivity titrs in an in vivo virus infectivity assay by 50 % at a concentration of less than 700 mg of antibody/ml, and binds mature gp120 preferentially over the precursor gp160. This sequence forms the heavy chain component of MAD's with the light chain sequences given in AAW01275-76, AAW01295, AAW01296, and AAW01296, and AAW01299-300. The MAD may be used for determining immunocompetence of a human anti-HTV antibody and

This sequence represents a fragment of the antibodies of the invention.

The invention relates to the production of an anti-HIV (human immunodeficiency virus) glycoprotein (gp)-120 monoclonal antibody capable of reducing an HIV infectivity titre in an in vitro virus infectivity assay by 50% at a concentration of less than 70 ng/ml. The method for the production of the antibody comprises: (a) providing a first polymucleotide encoding a heavy chain immunoglobulin amino acid sequence (which does not comprise the sequence represented by AAV98206) and a second polymucleotide encoding a light chain immunoglobulin amino acid sequences; (b) inserting the first and second polymucleotide sequences into a host cell; (c) maintaining the host cell in conditions which allow the amino acid sequences encoded by the polymucleotides to be expressed to the amino acid sequences encoded by the antibody comprising the heavy and light chain immunoglobulin amino acid sequences from the host cell; The antibody is used for providing passive
                                                                       ó
                                                                                                                                                                                                                                                                                                                           61 FQDRVTFTADTSANTAYMELRSLRSADTAVYYCARVGPYSWDDSPQDNYYMDVWGKGTTV 120

immunotherapy to HIV in a human. They can be administered to high-risk patients to reduce the likelihood and/or severity of HIV-induced disease and to patients who are already HIV-infected. The antibodies are used for neutralising field isolates which provides information about the immunocompetence of an immune response in HIV patients, for detecting HIV in a biological fluid or tissue sample e.g. by radioimmunosasy, for producing anti-idiotypic antibodies which can be used for active immunisation and to screen human monoclonal antibodies to identify those with the same binding specificity and to monitor the course of HIV with the same binding specificity and to monitor the course of HIV present in the body or in body fluids by immunoassay. The anti-HIV gp-120 monoclonal antibodies are encoded by a human polymuclectide sequence and when used in vivo for diagnosis and immunotherapy of HIV-induced disease reduce the problems of significant host immune response to the antibodies associated with monoclonal antibodies of xenogeneic or chimeric
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           FQDRVTFTADTSANTAYMELRSLRSADTAVYYCARVGPYSWDDSPQDNYYMDVWGKGTTV 142

a numan whose inmugationing (197) morecure within interpretation of a numan whose instance and a numan whose instance and a numan whose instance and a neutralises HIV and which reduces HIV infectivity titre in an invitation of no vitro vitrus infectivity assay by 50%, at a concentration of less than 700 ng/ml. The antibodies are used as reagents for the diagnosis and immunocherapy of HIV induced disease. They are useful as neutralising field isolates and provide useful information regarding the immunocompetence of an immune response in HIV infected patients. The monoclonal antibodies are useful for producing anti-idiotypic antibodies which can be used to screen human monoclonal antibodies to identify whether the antibody has the same binding specificity as the antibodies of the invention. The neutralising antibodies define new epitopes on the HIV interpretation and gp41 glycoproteins, thus increasing the availability of new immunocherapeutic human monoclonal antibodies. A major advantages of the monoclonal antibodies for diagnosis and immunocherapy of HIV induced disease greatly reduces the problems of significant host immune response to the passively administered antibodies which is a problem commonly encountered when monoclonal antibodies of the monoclonal antibodies of the monoclonal antibodies of the monoclonal antibodies of the monoclonal antibodies is described derives from the fact that they immunoreact with a unique determinant present on mature HIV glycoprotein gp120. This class of HIV produced problems of present on mature HIV glycoprotein gp120. This class of HIV singles is

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ઠે
                                                                                                                             The present amino acid sequence is the variable fragment (FV) of 3B3 antibody, isolated from a combinatorial phage display library constructed therem brome marrow RNA of an infected individual. It is used in a novel chimeric immunotoxin, that comprises an anti-gpl20 antibody, having binding specificity to 3B3(FV) antibody, that is attached by a connector peptide to a cytotoxic molety, PB38 derived from P.aeruginosa. The chimeric immunotoxin is used in the treatment of HIV-1 infections. It is capable of specifically targeting and killing cells displaying HIV-1 the HIV viral load in the infected cells. It can also be used in the establishing transformed cell lines derived from HIV-infected sources. The immunotoxins can also be used for detecting the presence or absence

```
The sequences given in AAR75604-09 represent human Fab's comprising variable chain heavy regions (VH), which bind to HIV gp120. The six amino acids which comprise CDR1 have been randomised with 3 of the six CDR1 sequences containing the preferred His residue as the first residue of CDR1 to avoid glycosylation, as occurs if Asn is present. These Fab's are used in the production of a human monoclonal antibody (WAb) which is capable of immunoreacting with, and neutralising HIV. The MAb's are capable of reducing HIV infectivity titre in an in vitro virus infectivity assay by 50% at a concentration of <100 ng of antibody per ml. They can be used to provide passive immunotherapy to HIV in a human. They neutralise HIV more effectively than antibodies selected from non-randomised combinatorial libraries
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  61 FQDRVTFTADTSANTAYMELRSLRSADTAVYYCARVGPYSWDDSPQDNYYMDVWGKGTTV 120

 AAR54245
             The sequences given in AAR75604-09 represent human Fab's comprising variable chain heavy regions (VH), which bind to HIV gpl20. The six amino secids which comprise CDR1 have been randomised with 3 of the six CDR1 sequences containing the preferred His residue as the first residue of CDR1 to avoid glycosylation, as occurs if Asn is present. These Fab's are used in the production of a human monoclonal antibody (VAb) which is capable of immunoreacting with, and neutralising HIV. The MAb's are capable of reducing HIV infectivity titre in an in vitro virus infectivity assay by 50% at a concentration of <100 ng of antibody per mil. They can be used to provide passive immunotherapy to HIV in a human. They neutralise HIV more effectively than antibodies selected from non-randomised combinatorial libraries
                                                                                                                                                                                                                                                                                                                                                      Synthetic human neutralising monoclonal antibodies to human immunodeficiency virus - used for diagnosis and immuno:therapy of HIV-

Lymphocyte mRNA was converted to cDNA and subjected to PCR amplification using primers specific for heavy and light chain variable regions. The amplification products were inserted into a dicistronic vector to produce a library of fragments. B.coli XLI Blue cells were transformed with the library. Filamentous phage were produced which expressed the MAD regions on their surface. Panning with gp120 and gp41 resulted in the recovery of immunoreactive clones. The heavy chain VH region sequence AAR64245 neutralises HIV1 gp120. (Updated on 25-MAR-2003 to correct PN field.)

This sequence represents the sequence of the JH6 gene clone, b7. A MAb containing this VH sequence has the capacity to reduce HIV infectivity titre in an in vivo virus infectivity assay by 50 % at a concentration of less than 700 ng of antibody/ml, and binds mature gp120 preferentially over the precursor gp160. The MAb may be used for detection of HIV infection
                                                                                                                                                                                                         Heavy chain; light chain; variable region; VH; monoclonal antibody; MAb; HIV; human immunodeficiency virus; glycoprotein; gpl20; clone; virus infectivity assisy; precursor gpl60; immunocompetence; human; anti-HIV antibody; detection; HIV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Monoclonal antibody binding to VI/V2 loop of HIV gp120 - used in passive immuno:therapy and detection of HIV infection.
                                                                                                                                                                                  TH region of HIV neutralising MAb, IgG1 b7.

This sequence represents a fragment of the antibodies of the invention. The invention relates to the production of an anti-HV (human immunodeficiency virus) glycoprotein (gp)-120 monoclonal antibody capable of reducing an HIV infectivity titre in an in vitro virus infectivity assay by 50% at a concentration of less than 70 mg/ml. The method for the projunction of the antibody comprises: (a) providing a first method for the polynucleotide encoding a heavy chain immunoglobulin anino acid sequence (which does not comprise the sequence represented by AAY98206) and a sequence (b) inserting the first and second polynucleotide sequences into a host cell; (c) maintaining the host cell in conditions which allow the main oacid sequences encoded by the polynucleotides to be expressed in the host cell; and (d) isolating the host cell in conditions which allow light chain immunoglobulin amino acid sequences from the host cell. The antibody comprisang the heavy and inthe that immunoglobulin antibody can be administered to high-risk patients to reduce the likelihood and/or severity of HIV-induced disease immunotherapy to HIV in a human. They can be administered to high-risk patients to reduce the likelihood and/or severity of HIV-induced disease and the mathor of the patients who are already HIV-infected. The antibodies are used for neutralising field isolates which provides information about the immunocompetence of an immune response in HIV patients, for detecting HIV

in a biological fluid or tissue sample e.g. by radioimmunoassay, for producing anti-idiotypic antibodies which can be used for active immunisation and to screen human monoclonal antibodies to identify those with the same binding specificity and to monitor the course of HIV disease therapy by measuring the changes in concentration of HIV present in the body or in body fluids by immunoassay. The anti-HIV gp-120 monoclonal antibodies are encoded by a human polymucleotide sequence and when used in vivo for diagnosis and immunotherapy of HIV induced disease reduce the problems of significant host immune response to the antibodies associated with monoclonal antibodies of xenogeneic or chimeric

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence represents a fragment of an anti-human immunodeficiency virus type 1 (HIV-1) antibody. The invention relates to a human whole immunodlobulin (Ig) molecule which immunoreacts with HIV mature glycoprotein gp120 preferentially over HIV precursor glycoprotein gp120 preferentially over HIV precursor glycoprotein gp140 and which reduces HIV infectivity titre in an in vitro virus infectivity assay by 50%, at a concentration of less than 700 ng/ml. The antibodies are used as reagents for the diagnosis and

field isolates and provide useful information regarding the immunocompetence of an immune response in HIV infected patients. The monoclonal antibodies are useful for producing anti-idiotypic antibodies of an immune response in HIV infected patients. The monoclonal antibodies to identify whether the antibody has the same binding specificity as the antibodies of the invention. The neutralising antibodies define new epitopes on the HIV gpl20 and gp41 glycoproteins, thus increasing the availability of new immunotherapeutic human monoclonal antibodies. A major advantages of the monoclonal antibodies derives from the fact that they are encoded by a human polynucleotides derives from the fact that they are encoded by a numbodies for diagnosis and immunotherapy of HIV induced disease greatly reduces the problems of significant host immune response to the passively administered antibodies which is a problem commonly encountered when monoclonal major advantage of the monoclonal antibodies described the monoclonal antibodies described the monoclonal antibodies described the monoclonal antibodies described the monoclonal antibodies described the monoclonal antibodies described the monoclonal antibodies described the monoclonal antibodies described the monoclonal antibodies described the monoclonal antibodies described the monoclonal antibodies described the monoclonal antibodies described the monoclonal antibodies described the monoclonal antibodies described the monoclonal antibodies described the monoclonal antibodies described the monoclonal antibodies described the monoclonal antibodies described the monoclonal antibodies described the monoclonal antibodies described the monoclonal antibodies described the monoclonal antibodies described the monoclonal antibodies described the monoclonal antibodies described the monoclonal antibodies described the monoclonal antibodies described the monoclonal antibodies described the monoclonal antibodies described the monoclonal antibodies described the monoclonal antibodies describe

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            23 LVQSGAEVKKPGASVKVSCQASGYRFSNFVIHWVRQAPGQRFEWMGWINPYNGNKEFSAK
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        derives from the fact that they immunoreact with a unique determinant present on mature HIV glycoprotein gp120. This class of antibodies is particularly effective at neutralising field isolates of HIV
as neutralising
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human, Fab; variable chain; heavy; light; region; VH; VD; HIV; gpl20;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                     The sequences given in AAR75604-09 represent human Fab's comprising variable chain heavy regions (VH), which bind to HIV gpl20. The six amino acids which comprise CDR1 have been randomised with 3 of the six CDR1 sequences containing the preferred His residue as the first residue of CDR1 to avoid glycosylation, as occurs if Asn is present. These Fab's are used in the production of a human monoclonal antibody (WAb) which is capable of immunoreacting with, and neutralising HIV. The MAD's are capable of reducing HIV infectivity titre in an in vitro virus infectivity assay by 50% at a concentration of <100 ng of antibody per mil. They can be used to provide passive immunotherapy to HIV in a human. They neutralise HIV more effectively than antibodies selected from nonrandomised combinatorial libraries
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          FODRVTFTADTSANTAYMELRSLRSADTAVYYCARVGPYSWDDSPQDNYYMDVWGKGTTV 142

The sequences given in AAR75604-09 represent human Fab's comprising variable chain heavy regions (VH), which bind to HIV gpl20. The six amino secids which comprise CDR1 have been randomised with 3 of the six CDR1 sequences containing the preferred His residue as the first residue of CDR1 to avoid glycosylation, as occurs if Asn is present. These Fab's are used in the production of a human monoclonal antibody (MAb) which is capable of immunoreacting with, and neutralising HIV. The MAb's are capable of reducing HIV infectivity titre in an in vitro virus infectivity assay by 50% at a concentration of <100 ng of antibody per mil. They can be used to provide passive immunotherapy to HIV in a human. They neutralise HIV more effectively than antibodies selected from nonrandomised combinatorial libraries
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        61 FQDRVTFTADTSANTAYMELRSLRSADTAVYYCARVGPYSWDDSPQDNYYMDVWGKGTTV 120

The amplification products were inserted into a dicistronic vector to produce a library of fragments. E.coli XII Blue calls were transformed with the library. Filamentous phage were produced which expressed the MAD regions on their surface. Panning with gpl20 and gp41 resulted in the recovery of immunoreactive clones. The heavy chain VH region sequence AARA4246 neutralises HIV1 gpl20. (Updated on 25-MAR-2003 to correct PN field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The sequences given in AAW01233-60 represent the heavy chain variable regions (VH) of a series of monoclonal antibodies (MAb's) which are immunoreactive with HIV glycoprotein gp120 and are capable of neutralising HIV. This sequence represents the sequence of the JH6 gene clone, b21. A MAb containing this VH sequence has the capacity to reduce HIV infectivity titre in an in vivo virus infectivity assay by 50 % at a concentration of less than 700 ng of antibody/ml, and binds mature gp120 preferentially over the precursor gp160. The MAb may be used for detection of HIV infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      9

This sequence represents a fragment of the antibodies of the invention.

The invention relates to the production of an anti-HIV (human immundeficiency virus) glycoprotein (gp).120 monoclonal antibody capable of reducing an HIV infectivity titre in an in vitro virus infectivity assay by 50% at a concentration of less than 70 ng/ml. The method for the production of the antibody comprises: (a) providing a first of production of the antibody comprises: (a) providing a first operation of the antibody comprises: (a) providing a first operation of the antibody comprises: (b) now of the antibody comprises; (b) providing a first operation of the antibodies of a light chain immunoglobulin amino acid sequences of second polymucleotide encoding a light chain immunoglobulin amino acid sequences in the host cell; (c) maintaining the host cell in conditions which allow the host cell; and (d) isolating the antibody comprising the heavy and in the host cell; and (d) isolating the antibody comprising the heavy and contral inferences in the number of sequences from the host cell. The anti-HIV gp-120 monoclonal antibody is used for providing passive immunocherapy to HIV in a human. They can be administered to high-risk patients to reduce the likelihood and/or severity of HIV induced disease and the patients who are already HIV-infected. The antibodies are used for neutralising field isolates which provides information about the immunocompetence of an immune response in HIV patients, for detecting HIV producing anti-idictypic antibodies which can be used for active immunisation and to screen human monoclonal antibodies to identify those with the same binding specificity and to monitor the course of HIV patients in the body or in body fluids by immunoassay. The anti-HIV gp-120 concentration of HIV by a human polymucleotide sequence and monoclonal antibodies are encoded by a human polymucleotide sequence and monoclonal antibodies are encoded by a human polymucleotide sequence and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence represents a fragment of an anti-human minimunodeficiency virus type 1 (HIV-1) antibody. The invention relates to a human whole immunoglobulin (Ig) molecule which immunoreacts with HIV mature glycoprotein gpi20 preferentially over HIV precursor glycoprotein gp160 and neutralises HIV and which reduces HIV infectivity titre in an in vitro virus infectivity assay by 50%, at a concentration of less than 700 ng/ml. The antibodies are used as reagents for the diagnosis and immunotherapy of HIV induced disease. They are useful as neutralising field isolates and provide useful information regarding the immunocompetence of an immune response in HIV infected patients. The monoclonal antibodies are useful for producing anti-idiotypic antibodies which can be used to screen human monoclonal antibodies to identify whether the antibody has the same binding specificity as the antibodies of the invention. The neutralising antibodies define new epitopes on the

HIV gpl20 and gp41 glycoproteins, thus increasing the availability of new immunotherapeutic human monoclonal antibodies. A major advantages of the monoclonal antibodies derives from the fact that they are encoded by a human polynuclectides sequence. Thus in vivo use of the monoclonal antibodies for diagnosis and immunotherapy of HIV induced disease greatly administered antibodies which is a problem commonly encountered when monoclonal antibodies of significant host immune response to the passively administered antibodies of significant or chimeric derivation are utilized. An additional major advantage of the monoclonal antibodies described derives from the fact that they immunoreact with a unique determinant present on mature HIV glycoprotein gpl20. This class of antibodies is particularly effective at neutralising field isolates of HIV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     FODRVTFTADTSANTAYMELRSLRSADTAVYYCARVGPYSWDDSPQDNYYMDVWGKGTTV 142

The sequences given in AAR75604-09 represent human Fab's comprising variable chain heavy regions (VH), which bind to HIV gpl20. The six amino secids which comprise CDR1 have been randomised with 3 of the six CDR1 sequences containing the preferred His residue as the first residue of CDR1 to avoid glycosylation, as occurs if Asn is present. These Fab's are capable of immunoreacting with, and neutralising HIV. The MAD's are capable of reducing HIV infectivity titre in an in vitro virus infectivity assay by 50% at a concentration of <100 ng of antibody per min. They can be used to provide passive immunotherapy to HIV in a human. They neutralise HIV more effectively than antibodies selected from non-randomised combinatorial libraries
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   83 FQDRVTFTADTSANTAYMELRSLRSADTAVYYCARVGPYSWDDSPQDNYYMDVWGKGTTV 142

```
The sequences given in AAR75568-72 represent human Fab's comprising variable chain heavy regions (VH), which bind to HIV gp120. The Fab's 510, 353, 364 and 35b have the same amino acid composition as MT4 but have randomised amino acids in the entire CDR1 and in four of the 18 amino acid residues in CDR3. These Fab's are used in the production of a human monoclonal antibody (MAb) which is capable of immunoreacting with, and neutralising HIV. The MAb's are capable of reducing HIV infectivity titre in an in vitro virus infectivity assay by 50% at a concentration of sillong of antibody per ml. They can be used to provide passive timmunotherapy to HIV in a human. They cantestales HIV more effectively than antibodies selected from non-randomised combinatorial libraries
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Synthetic human neutralising monoclonal antibodies to human immunodeficiency virus - used for diagnosis and immuno:therapy of HIV-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             81.5%; Score 646; DB 2;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The sequences given in AAR75604-09 represent human Fab's comprising variable chain heavy regions (VH), which bind to HIV gpl20. The six amino acids which comprise CDR1 have been randomised with 3 of the six CDR1 sequences containing the preferred His residue as the first residue of CDR1 to avoid glycosylation, as occurs if Asn is present. These Fab's are used in the production of a human monoclonal antibody (MAD) which is capable of immunoreacting with, and neutralising HIV. The MAD's are capable of reducing With, and neutralising HIV. The MAD's are infectivity assay by 50% at a concentration of <100 ng of antibody per mil. They can be used to provide passive immunotherapy to HIV in a human. They neutralise HIV more effectively than antibodies selected from nonrandomised combinatorial libraries
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           142

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The sequences given in AAR75568-72 represent human Fab's comprising variable chain heavy regions (VH), which bind to HIV gp120. The Fab's 3b1, 3b3, 3b4 and 3b9 have the same amino acid composition as MT4 but have randomised amino acids in the entire CDR1 and in four of the 18 amino acid residues in CDR3. These Fab's are used in the production of a human monoclonal antibody (MAb) which is capable of immunoreacting with, and neutralising HIV. The MAb's are capable of reducing HIV infectivity titre in an in vitro virus infectivity assay by 50% at a concentration of immunotherapy to HIV in a human. They neutralise HIV more effectively than antibodies selected from non-randomised combinatorial libraries
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           1 LEQSGAEVKKPGASVKVSCQASGYRFSNFTVHWVRQAPGQRFEWMGWINPYNGNKEFSAK 60

                                                    The anti-HIV gp120 light chain clone b12 (AARS4253) was recombined with a heavy chain library to construct a new library L12-HCn. Ten heavy chains which recombined with the b12 light chain and bound gp120 by panning were chosen for sequence analysis. AARS4335 was one of these heavy chains. (Updated on 25-MAR-2003 to correct PN field.)

This sequence represents the sequence of the gene clone, HG12. These sequences represent heavy chains which bind to the b12 light chain clone (see also AAW01276). These sequences were isolated from the shuffled heavy chain library, Hn-L12. A MAD containing this VH

```
sequence has the capacity to reduce HIV infectivity titre in an in vivo virus infectivity assay by 50 % at a concentration of less than 700 ng of antibody/ml, and binds mature gp120 preferentially over the precursor gp160. The MAD may be used for determining immunocompetence of a human anti-HIV antibody and in the detection of HIV infection. The heavy chain clones designated H2 and H14 exhibited approx. 40 % neutralisation of HIV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This sequence represents a fragment of the antibodies of the invention. The invention relates to the production of an anti-HIV (human limmunodeficiency virus) glycoprotein (gp)-120 monoclonal antibody capable of reducing an HIV infectivity titre in an in vitro virus infectivity assay by 50% at a concentration of less than 70 ng/ml. The method for the production of the antibody comprises: (a) providing a first polynucleotide encoding a heavy chain immunoglobulin amino acid sequence (which does not comprise the sequence represented by AAY98206) and a second polynucleotide encoding a light chain immunoglobulin amino acid
                                                                                                                                                                                                                                                                                                                                                                                                                           120
                                                                                                                                                                                                                                                                                                                                                                                  138

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               RESULT 30
```

sequence; (b) inserting the first and second polymucleotide sequences into a host cell; (c) maintaining the host cell in conditions which allow the amino acid sequences encoded by the polymucleotides to be expressed in the host cell; and (d) isolating the antibody comprising the heavy and light chain immunoglobulin amino acid sequences from the host cell. The anti-HV gp-120 monoclonal antibody is used for providing passive.

Comparisons to reduce the likelihood and/or severity of HIV-induced disease immunotherapy to HIV in a human. They can be administered to high-risk patients to reduce the likelihood and/or severity of HIV-induced disease.

Comparisons field isolates which provides information about the neutralising field isolates which provides information about the immunocompetence of an immune response in HIV patients, for detecting HIV in a biological fluid or tissue sample e.g. by radioinmunoassay, for producing anti-idiotypic antibodies which can be used for active immunisation and to screen human annoclonal antibodies to identify those with the same binding specificity and to monitor the course of HIV of disease therapy by measuring the changes in concentration of HIV present in the body or in body fluids by immunoassay. The anti-HIV gp-120 monoclonal antibodies are encoded by a human polymucleotide sequence and when used in vivo for diagnosis and immunotherapy of HIV-induced disease reduce the problems of significant host immunotherapy of the antibodies associated with monoclonal antibodies of xenogeneic or chimeric \$

                                                                          à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Lymphocyte mRNA was converted to cDNA and subjected to PCR amplification using primers specific for heavy and light chain variable regions. The amplification products were inserted into a dicistronic vector to produce a library of fragments. E.coli XLI Blue cells were transformed with the library. Filamentous phage were produced which expressed the MAb regions on their surface. Panning with gpl20 and gp41 resulted in the recovery of immunoreactive clones. The heavy chain WH region sequence AARS424 neutralises HIV1 gpl20. (Updated on 25-MAR-2003 to correct PN field.)

AAR54244

```
Synthetic human neutralising monoclonal antibodies to human immunodeficiency virus - used for diagnosis and immuno:therapy of HIV-induced disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The sequences given in AAR75568-72 represent human Fab's comprising variable chain heavy regions (VH), which bind to HIV gp120. The Fab's 3b1, 3b3, 3b4 and 3b9 have the same amino acid composition as MT4 but
  HIV; gp120;

have randomised amino acids in the entire CDR1 and in four of the 18 amino acid residues in CDR3. These Fab's are used in the production of a human monoclonal antibody (WAb) which is capable of immunoreacting with, and neutralising HIV. The MAb's are capable of reducing HIV infectivity titre in an in vitro virus infectivity assay by 50% at a concentration of 100 ng of antibody per mi. They can be used to provide passive immunotherapy to HIV in a human. They neutralise HIV more effectively than antibodies selected from non-randomised combinatorial libraries
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             FQDRVIFTADISANTAYMELRSLRSADIAVYYCARVGPYSWDDSPQDNYYMDVWGKGTIV 120

                                                                                                                                          This sequence represents the heavy chain variable region (VH) of a monoclonal antibody (MAb) which is immunoreactive with HIV glycoprotein gp120 and is capable of neutralising HIV. This sequence represents the sequence of clones b4 and b12. The MAb has the capacity to reduce HIV infectivity tire in an in vivo virus infectivity assay by 50 % at a concentration of less than 700 ng of antibody/ml, and binds mature gp120 preferentially over the precursor gp160. This sequence forms the heavy chain component of MAb's with the light chain sequences given in heavy be used for determining immunocompetence of a human anti-HIV antibody and in the detection of HIV infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 9
                                      Monoclonal antibody binding to V1/V2 loop of HIV gp120 - used in passive immuno:therapy and detection of HIV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human neutralizing monoclonal antibodies to human immunodeficiency virus (HIV) used for providing passive immunotherapy to HIV are specific for glycoprotein-120.

The present sequence represents a fragment of an anti-human immunodeficiency virus type 1 (HIV-1) antibody. The invention relates to a human whole immunodeablulin (IG) molecule which immunoreacts with HIV mature glycoprotein gpl20 preferentially over HIV precursor glycoprotein gpl20 preferentially over HIV precursor glycoprotein gpl20 preferentially over HIV infectivity titre in an invitro virus infectivity assay by 50%, at a concentration of less than 700 ng/ml. The antibodies are useful season to regarding the dispussion of the immunocompetence of an immune response in HIV infected patients. The monoclonal antibodies are useful for producing antibodies on the immunocompetence of an immune response in HIV infected patients. The monoclonal antibodies are useful for producing antibodies to identify whether the antibody has the same binding specificity as the antibodies of the invention. The neutralising antibodies define new epitopes on the HIV glycoproteins, thus in vivo use of the availability of new immunotherapeutic human monoclonal antibodies. A major advantages of the monoclonal antibodies for diagnosis and immunotherapy of HIV induced disease greatly reduces the problems of significant host immune response to the passively administered antibodies which is a problem commonly encountered when monoclonal antibodies of the monoclonal antibodies of the monoclonal antibodies of the monoclonal antibodies of the monoclonal antibodies of the monoclonal antibodies of the monoclonal antibodies of the monoclonal antibodies of the monoclonal antibodies of the monoclonal antibodies of the monoclonal antibodies of the monoclonal antibodies of particularly effective at neutralising field isolates of HIV glycoprotein glield isolates of HIV glycoprotein glield isolates of HIV
                                                                                                                                                                                                                                                                                                                     Novel human monoclonal antibodies which immunoreact with and neutralize human immunodeficiency virus useful for treating HIV infections.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         à
                                                This sequence represents a fragment of the antibodies of the invention.

The invention relates to the production of an anti-HIV (human immunodeficiency virus) glycoprotein (gp)-120 monoclonal antibody capable of reducting an HIV infectivity titre in an in vitro virus infectivity casay by 50% at a concentration of less than 70 ng/ml. The method for the production of the antibody comprises: (a) providing a first production of the antibody comprises: (a) providing a first production of the antibody comprises: (a) providing a first production of the antibody comprises the sequence represented by AAY98206) and a second polynucleotide sequence (which does not comprise the sequence represented by AAY98206) and a second polynucleotide sequence into a host cell; (a) maintaining the host cell in conditions which allow the amino acid sequences encoded by the polynucleotides to be expressed into a host cell; and (d) isolating the host cell in conditions which allow the most cell; and (d) isolating the matipody comprising the heavy and light chain immunoglobulin amino acid sequences from the host cell; and (d) isolating the antibody comprising the heavy and clight chain immunoglobulin amino acid sequences from the host cell; and to patients who are already HIV infected. The administered to high-risk patients to reduce the likelihood and/or severity of HIV induced disease and to patients who are already HIV infected. The antibodies are used for neutralising field isolates which provides information about the immune response in HIV patients, for detecting HIV conducing anti-idiotypic antibodies which can be used for action and to screen human monoclonal antibodies to identify those immunity and antibodies are necessary conditional antibodies by immunosassay. The anti-HIV gp-120 monoclonal antibodies are encoded by immunosassay. The anti-HIV parises are encoded by immunosassay. The anti-HIV parises are encoded by immunosassay. The anti-HIV parises are encoded by incorder encoded by immunosassay. The anti-HIV parises of HIV mon
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ô

This sequence represents the heavy chain variable region (VH) of a monoclonal antibody (MAD) which is immunoreactive with HIV glycoprotein gp120 and is capable of neutralising HIV. This sequence contains the leader sequence derived from the mouse B72.3 heavy chain, and the human VH consensus sequence attached to the N-terminal of the b12 VH sequence. The DNA sequence contains a Kozak sequence for the control of VH expression. This sequence was amplifted using the primer sequences given in AAT40889-92. A MAD containing this VH sequence has the capacity to reduce HIV infectivity titre in an in vivo virus infectivity assay by 50 g at a concentration of less than 700 mg of antibody/mi, and binds mature determining immunocompetence of a human anti-HIV antibody and in the determining immunocompetence of a human anti-HIV antibody and in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Monoclonal antibody binding to V1/V2 loop of HIV gp120 - used in passive immuno:therapy and detection of HIV infection.

This sequence represents a fragment of the antibodies of the invention.

The invention relates to the production of an anti-HIV (human immunodeficiency virus) glycoprotein (gp)-120 monoclonal antibody capable of reducing an HIV infectivity titre in an in vitro virus infectivity assay by 50% at a concentration of less than 70 mg/ml. The method for the production of the antibody comprises: (a) providing a first of production of the antibody comprises: (b) providing a first of production of the antibody comprises: (a) providing a first of production of the antibody comprises: (b) providing a first of second polymucleotide encoding a laght chain immunoglobulin amino acid sequence. (b) inserting the first and second polymucleotide sequences from the host cell; (c) maintaining the host cell in conditions which allow the host cell; and (d) isolating the antibody comprising the heavy and in the host cell; and (d) isolating the antibody comprising the heavy and light chain immunoglobulin amino acid sequences from the host cell. The antibody comprising the heavy and contral immunoglobulin amino acid sequences from the host cell. The antibody comprising to reduce the likelihood and/or severity of HIV-induced disease to patients who are already HIV-infected. The antibodies are used for neutralising field isolates which provides information about the immunocompetence of an immune response in HIV patients, for detecting HIV in a blological fluid or tissue sample e.g. by radioimmunoassay, for in a blological fluid or tissue sample e.g. by radioimmunoassay, for contribution and to screen human anoncolonal antibodies to identify those with the same binding specificity and to monitor the course of HIV disease therapy by measuring the changes in concentration of HIV present in the body or in body fluids by immunoassay. The anti-HIV gp-120 concolonal antibodies are encoded by a human polymorious are produced by a human polymorious and in vivo for diagnosis and immunotherapy of HIV-induced disease recovered by a separation of the a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human neutralizing monoclonal antibodies to human immunodeficiency viru (HIV) used for providing passive immunotherapy to HIV are specific for glycoprotein-120.
                                                                                                                                                    Antibody; anti-HIV monoclonal antibody; glycoprotein-120; human immunodéficiency virus type 1; HIV-1; infectivity titre; passive immunotherapy; reduce severity; HIV-induced disease; immunocompetence; active immunisation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       0

The present sequence represents a fragment of an anti-human continuation that the present sequence represents a fragment of an anti-human continuation that the fragment of a human whole immunofability [19] molecule which immunofacts with HIV mature glycoprotein gpl20 preferentially over HIV precursor glycoprotein gpl20 preferentially over HIV precursor glycoprotein gpl20 and which reduces HIV infectivity titre in an involution in vitro virus infectivity assay by 50%, at a concentration of less than 700 mg/ml. The antibodies are used as reagents for the diagnosis and immunotherapy of HIV induced disease. They are useful as neutralising client isolates and provide useful information regarding the immunocherapy of HIV induced disease. They are useful as neutralising which can be used to screen human monoclonal antibodies to identify which can be used to screen human monoclonal antibodies to identify whether the antibody has the same binding specificity as the antibodies of the neutralising antibodies define new epitopes on the HIV gpl20 and gpl glycoproteins, thus increasing the availability of new immunotherapeutic human monoclonal antibodies sequence. Thus in vivo use of the monoclonal antibodies sequence. Thus in vivo use of the monoclonal antibodies which is a problem commonly encountered when continual antibodies of sanguation of the monoclonal antibodies of the monoclonal antibodies of the monoclonal antibodies decrement commonly encountered when monoclonal antibodies of the monoclonal antibodies of the monoclonal antibodies of the monoclonal antibodies of the monoclonal antibodies of the passively reduces from the fact that they immunored with a unique determinant present on mature HIV glycoprotein gpl20. This class of antibodies is particularly effective at neutralising field isolates of HIV
                                                                120

CC polypeptide from which the motif is derived, where the resulting hybrid CC infectious conformer of the polypeptide that is the source of the polypeptide that is the source of the polypeptide that is the source of the polypeptide that is the source of the polypeptide motif compared to a benign form of the polypeptide. Also described: (1) a nucleic acid molecule, (3) a cell comprising the vector. (4) detecting an isoform or a PreSc form of a prion polypeptide or a prescribed seasociated with a disease of protein aggregation, in a sample of polypeptide associated with a disease of protein aggregation; (7) preparing a phyrid molecule that specifically interacts with one conformer of a protein involved in the disease mentioned above; (8) an anni-idiotype antibody that the disease mentioned above; and (8) an anni-idiotype antibody that the disease mentioned above; and (8) an anni-idiotype antibody that the disease mentioned above; and (8) an anni-idiotype antibody that the disease mentioned above; and (8) an anni-idiotype antibody that the disease mentioned above; and disease, antipoly antidiabetic, anticonvulsant, (1) has cerebroprotective, antiparkinsonian, cytostatic, nephrotropic, cardiant, antiparkinsonian, cytostatic, nephrotropic, cardiant, conformation, such as Creutzfeldt-Jaxob disease, scrapie and bovine conformation; such as Creutzfeldt-Jaxob disease, preating and bovine conformation; and methods of the present invention can be used in spongiform encephalopathy, Alzheimer's disease, preative myloidosis associated with autosomic inflammatory disease, preative myloidosis associated with autosomic inflammatory disease, predict of wyloidosis associated with autosomic inflammatory disease, predict of anyloidosis associated with autosomic call deminant inheritance of variant candy protein gene, amyotrophic lateral sclerosis, pick's disease, productermoral deminant myloidosis myloidosis, chronic renal failure, congestive heart failure, senile corfaring and systemic amyloidosis, chronic renal failure, congestiv
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            FQDRVTFTADTSANTAYMELRSLRSADTAVYYCARVGPYSWDDSPQDNYYMDVWGKGTTV 120

The invention relates to a recombinant adeno-associated virus (rAAV)/
IgG1b12 or rAAV/ScFvX5 genome. The rAAV is useful for gene delivery,
particularly in delivering antibody genes to target cells in mammals. The
antibodies may be used to prevent and/or treat viral infections
(particularly HIV), bacterial infections and other chronic disease states
(e.g. cancer, rehumatoid arthritis, inflammation, fatal familial
insomnia, kuru, Mad Cow Disease or Alpers syndrome). The present sequence
represents the human monoclonal antibody (MAD) IgG1b12 heavy chain
                                                                                                                                                                                                                                                                                                                                                                                                                 ö

```
The sequences given in AAR75604-09 represent human Fab's comprising variable chain heavy regions (VH), which bind to HIV gp120. The six amino acids which comprise CDR1 have been randomised with 3 of the six CDR1 sequences containing the preferred His residue as the first residue of CDR1 to avoid glycosylation, as occurs if Asn is present. These Fab's are used in the production of a human monoclonal antibody (MAD) which is capable of immunoreacting with, and neutralising HIV. The MAD's are capable of reducing HIV infectivity titre in an in vitro virus infectivity assay by 50% at a concentration of <100 ng of antibody per mil. They can be used to provide passive immunotherapy to HIV in a human. They neutralise HIV more effectively than antibodies selected from non-randomised combinatorial libraries
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Synthetic human neutralising monoclonal antibodies to human immunodeficiency virus - used for diagnosis and immuno:therapy of HIV-

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                 The sequences given in AAR75604-09 represent human Fab's comprising variable chain heavy regions (VH), which bind to HIV gpl20. The six amino acids which comprise CDR1 have been randomised with 3 of the six CDR1 sequences containing the preferred His residue as the first residue of CDR1 to avoid glycosylation, as occurs if Asn is present. These Fab's are used in the production of a human monoclonal antibody (Mhb) which is capable of immunoreacting with, and neutralising HIV. The Mhb's are capable of reducing HIV infectivity titre in an in vitro virus infectivity assay by 50% at a concentration of <100 ng of antibody per mil. They can be used to provide passive immunotherapy to HIV in a human. They neutralise HIV mere effectively than antibodies selected from nonrandomised combinatorial libraries
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  0

                                                                                                                                                                                                                                                                                                                                                                                   Region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                Region
                                                                                                                                                                                                                                                                                                                                                                                                             Region
                                                                                                                                                                                                                                                                                                                                                                                                                                      Region
                                                                                                     à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     using primers specific for heavy and light chain variable regions. The amplification products were inserted into a dicistronic vector to produce a library of fragments. E.coli XLI Blue cells were transformed with the library. Filamentous phage were produced which expressed the MAb regions on their surface. Panning with 9p120 and 9p41 resulted in the recovery of immunoreactive clones. The heavy chain VH region sequence AARS4245 neutralises HIVI gp120. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              FQDRVTFTADTDANTAIMELRSLRSADTAIYYCARVGPYTWDDSPQDNYYMDVWGKGTKV 120

This sequence represents the sequence of the JHG gene clone, b7. A Mab containing this VH sequence has the capacity to reduce concentration of less than 700 ng of antibody/ml, and binds mature gpl20 preferentially over the precursor gpl60. The Mab may be used for determining immunocompetence of a human anti-HIV antibody and in the
                                                                                                                                                                                                                      Heavy chain; light chain; variable region; VH; monoclonal antibody; MAb; HIV; human immunodeficiency virus; glycoprotein; gp120; clone; virus infectivity assay; precursor gp160; immunocompetence; human; anti-HIV antibody; detection; HIV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Monoclonal antibody binding to V1/V2 loop of HIV gp120 - used in passive immuno:therapy and detection of HIV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                .

This sequence represents a fragment of the antibodies of the invention.

The invention relates to the production of an anti-HIV (human content on relates to the production of an anti-HIV (human content on the production of the monoclonal antibody capable of reducing an HIV infectivity titre in an in vitro virus infectivity casay by 50% at a concentration of less than 70 ng/ml. The method for the production of the antibody comprises: (a) providing a first confidence encoding a heavy chain immunoglobulin amino acid sequence (which does not comprise the sequence represented by AAY98206) and a second polymuclectide encoding a light chain immunoglobulin amino acid sequences (which does not comprise the sequence represented by AAY98206) and a second polymuclectide sequences into a host cell; (c) maintaining a light chain immunoglobulin amino acid sequences into a most cell; and (d) isolating the host cell in conditions which allow the amino acid sequences encoded by the polymuclectides to be expressed in the amino acid sequences encoded by the polymuclectides to be expressed in the amino acid sequences from the host cell. The anti-HIV gp-120 monoclonal antibody is used for providing passive confinents to reduce the likelihood and/or severity of HIV-induced disease and to patients who are already HIV-infected. The antibodies are used for meutralising field isolates which provides information about the immunocompetence of an immune response in HIV patients, for detecting HIV in a biological fluid or tissue sample e.g. by radioimmunoassay, for producing anti-idiotypic antibodies which can be used for active
                                                                                                                          120

immunisation and to screen human monoclonal antibodies to identify those with the same binding specificity and to monitor the course of HIV disease therapy by measuring the changes in concentration of HIV present in the body or in body fluids by immunoassay. The anti-HIV gp-120 monoclonal antibodies are encoded by a human polymucleotide sequence and when used in vivo for diagnosis and immunotherapy of HIV-induced disease reduce the problems of significant host immune response to the antibodies associated with monoclonal antibodies of xenogeneic or chimeric
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence represents a fragment of an anti-human immunodeficiency virus type 1 (HIV-1) antibody. The invention relates to a human whole immunoglobulin (19) molecule which immunoracts with HIV mature glycoprotein gp120 preferentially over HIV precursor glycoprotein gp160 and meutralises HIV and which reduces HIV infectivity titre in an in vitro virus infectivity assay by 50%, at a concentration of less than 700 ng/ml. The antibodies are used as reagents for the diagnosis and immunotherapy of HIV induced disease. They are useful as neutralising field isolates and provide useful information regarding the
                                                                                                                                                                                                                                                                                                                                                         120

communocompetence of an immune response in HIV infected patients. The monoclonal antibodies are useful for producing anti-idiotypic antibodies which can be used to screen human monoclonal antibodies to identify which can be used to screen human monoclonal antibodies to identify whether the antibody has the same binding specificity as the antibodies of the invention. The neutralising antibodies define new epitopes on the HIV gp120 and gp41 glycoproteins, thus increasing the availability of new immunotherapeutic human monoclonal antibodies. A major advantages of the monoclonal antibodies sequence. Thus in vivo use of the monoclonal antibodies for diagnosis and immunotherapy of HIV induced disease greatly reduces the problems of significant host immune response to the passively reduces the problems of significant host immune response to the passively connocloral antibodies which is a problem commonly encountered when monoclonal major advantage of the monoclonal antibodies described derives from the fact that they immunoreact with a unique determinant present on mature HIV glycoprotein gp120. This class of antibodies is particularly effective at neutralising field isolates of HIV

The sequences given in AAR75604-09 represent human Fab's comprising variable chain heavy regions (VH), which bind to HIV gpl20. The six amino secids which comprise CDR1 have been randomised with 3 of the six CDR1 sequences containing the preferred His residue as the first residue of CDR1 to avoid glycosylation, as occurs if Asn is present. These Fab's are used in the production of a human monoclonal antibody (MAb) which is capable of immunoreacting with, and neutralising HIV. The MAb's are capable of reducing HIV infectivity titre in an in vitro virus infectivity assay by 50% at a concentration of <100 ng of antibody per ml. They neutralise HIV more effectively immunotherapy to HIV in a human. They neutralise HIV more effectively than antibodies selected from nonrandomised combinatorial libraries
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

                                                                                                                                                                                                                                                                                                                                         The sequences given in AAR75604-09 represent human Fab's comprising variable chain heavy regions (VH), which bind to HIV gp120. The six amino acids which comprise CDR1 have been randomised with 3 of the six CDR1 sequences containing the preffered His residue as the first residue of CDR1 to avoid glycosylation, as occurs if Asn is present. These Fab's are used in the production of a human monoclonal antibody (MAB) which is capable of immunoreacting with, and neutralising HIV. The MAD's are capable of reducing HIV infectivity titre in an in vitro virus infectivity assay by 50% at a concentration of <100 mg of antibody per m1. They can be used to provide passive immunotherapy to HIV in a human. They neutralise HIV more effectively than antibodies selected from nonrandomised combinatorial libraries
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ó;

                                                                                                                                                                                                          Lymphocyte mRNA was converted to cDNA and subjected to PCR amplification using primers specific for heavy and light chain variable regions. The amplification products were inserted into a dicistronic vector to produce a library of fragments. E.coli XLI Blue cells were transformed with the library. Filamentous phage were produced which expressed the MAb regions on their surface. Panning with gpl20 and gp41 resulted in the recovery of immunoreactive clones. The heavy chain VH region sequence AARS4246 neutralises HIVI gpl20. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       1 LEQSGAEVKKPGASVKVSCQASGYRFSNFVIHWVRQAPGQRFEWMGWINPYNGNKEFSAK 60

The sequences given in AAW01233-60 represent the heavy chain variable regions (VH) of a series of monoclonal antibodies (MAb's) which are immunoreactive with HIV glycoprotein gp120 and are capable of neutralising HIV. This sequence represents the sequence of the JH6 gene clone, b21. A MAb containing this VH sequence has the capacity to reduce HIV infectivity titre in an in vivo virus infectivity assay by 50 % at a concentration of less than 700 mg of antibody/ml, and binds mature gp120 determining immunocompetence of a human anti-HIV antibody and in the detection of HIV infection
                                                                                                 Heavy chain; light chain; variable region; VH; monoclonal antibody; MAb; HIV; human immunodeficiency virus; glycoprotein; gp120; clone; virus infectivity assay; precursor gp160; immunocompetence; human; anti-HIV antibody; detection; HIV infection.

This sequence represents a fragment of the antibodies of the invention.

The invention relates to the production of an anti-HV (human immunodeficiency virus) glycoprotein (9p)-120 monoclonal antibody capable of reducing an HIV infectivity titre in an in vitro virus infectivity assay by 50% at a concentration of less than 70 mg/ml. The method for the production of the antibody comprises: (a) providing a first comprises the argument of the antibody comprises: (a) providing a first comprise the sequence represented by AAV98206) and a second polymucleotide encoding a light chain immunoglobulin amino acid sequence (which does not comprise the sequence represented by AAV98206) and a second polymucleotide encoding a light chain immunoglobulin amino acid sequence into a host cell; (c) maintaining the host cell in conditions which allow the maino acid sequences encoded by the polymucleotides to be expressed in the host cell; and (d) isolating the antibody comprising the heavy and light chain immunoglobulin amino acid sequences from the host cell. The anti-HIV gp-120 monoclonal antibody is used for providing passive immunotherapy to HIV in a human. They can be administered to high-risk parients to reduce the likelihood and/or severity of HIV-induced disease and to patients who are already HIV-infected. The antibodies are used for neutralising field isolates which provides information about the producing anti-idiotypic antibodies information about the conduction and to screen human monoclonal antibodies to identify those immunisation and to screen human monoclonal antibodies to identify those with the same binding specificity and to monitor the course of HIV disease therapy by measuring the changes in concentration of HIV present in the body or in body fluids by immunossay. The anti-HIV gp-120 monoclonal antibodies are encoded by a human polynucleotide sequence and when used in vivo for disagness and immunotenessy of HIV-induced disease reduce the problems of significant host immune response to the antibodies.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence represents a fragment of an anti-human immunodeficiency virus type 1 (HIV-1) antibody. The invention relates to a human whole immunoglobulin (Ig) molecule which immunoreacts with HIV mature glycoprotein gpl20 preferentially over HIV precursor glycoprotein gpl60 and neutralises HIV and which reduces HIV infectivity tire in an in vitro virus infectivity assay by 50% at a concentration of less than 700 mg/ml. The antibodies are used as reagents for the diagnosis and immunotherapy of HIV induced disease. They are useful as neutralising field isolates and provide useful information regarding the entralising monocolonal antibodies are useful for producing anti-diotypic antibodies which can be used to screen human monoclonal antibodies to identify whether the antibody has the same binding specificity as the antibodies of the invention. The heurstalishing antibodies define new epitopes on the HIV gpl20 and gp41 glycoproteins, thus increasing the availabbility of new immunotherapeutic human monoclonal antibodies. monoclonal antibodies derives from the fact that they are encoded by a human polynucleotides sequence. Thus in vivo use of the monoclonal artibodies for diagnosis and immunocherapy of HIV induced disease greatly reduces the problems of significant host immune response to the passively administered antibodies which is a problem commonly encountered when monoclonal antibodies of xenogeneic or chimeric derivation are utilized. An additional major advantage of the monoclonal antibodies described derives from the fact that they immunoreact with a unique determinant present on mature HIV glycoprotein gpl20. This class of antibodies is particularly effective at neutralising field isolates of HIV
                                                                                                                                                                                                                                                                                                                                                                                                                 ö

The sequences given in AAR75604-09 represent human Fab's comprising variable chain heavy regions (VH), which bind to HIV gp120. The six amino secids which comprise CDR1 have been randomised with 3 of the six CDR1 sequences containing the preferred His residue as the first residue of CDR1 to avoid glycosylation, as occurs if Asn is present. These Fab's are used in the production of a human monoclonal antibody (MAb) which is capable of immunoreacting with, and neutralising HIV. The MAb's are capable of reducing HIV infectivity titre in an in vitro virus infectivity assay by 50% at a concentration of <100 mg of antibody per all. They neutralise HIV more effectively immunotherapy to HIV in a human. They neutralise HIV more effectively than antibodies selected from nonrandomised combinatorial libraries
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             FQDRVTFTADTSANTAYMELRSLRSADTAVYÝCARVGPYSWDDSPQDNYYMDVWGKGTTV 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The sequences given in AAR75604-09 represent human Fab's comprising variable chain heavy regions (VH), which bind to HIV gpl20. The six amino scales which comprise CDR1 have been randomised with 3 of the six CDR1 sequences containing the preferred His residue as the first residue of CDR1 to avoid glycosylation, as occurs if Asn is present. These Fab's are used in the production of a human monoclonal antibody (MAD) which is capable of immunoreacting with, and neutralising HIV. The MAD's are capable of reducing HIV infectivity titre in an in vitro virus infectivity assay by 50% at a concentration of <100 ng of antibody per m1. They can be used to provide passive immunotherapy to HIV in a human. They neutralise HIV more effectively than antibodies selected from nor randomised combinatorial libraries

The sequences given in AAR75568-72 represent human Fab's comprising variable chain heavy regions (VH), which bind to HIV gp120. The Fab's bl., 383, 3b4 and 3b9 have the same amino acid composition as MT4 but have randomised amino acids in the entire CRN1 and in four of the 18 amino acid residues in CBR3. These Fab's are used in the production of animan monoclonal antibody (MAb) which is capable of immunoreacting with, and neutralising HIV. The MAb's are capable of reducing HIV infectivity titre in an in vitro virus infectivity assay by 50% at a concentration of antibody per ml. They can be used to provide passive immunotherapy to HIV in a human. They neutralise HIV more effectively than antibodies selected from non-randomised combinatorial libraries
                                                                                                                                                                                                                                                                            Synthetic human neutralising monoclonal antibodies to human immunodeficiency virus - used for diagnosis and immuno:therapy of HIV-
                                                                                                                                                                                                                                                                                                                                                                                                                                                         Length 124;
                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match

                                                                                                                                                                                                                          The sequences given in AAR75568-72 represent human Fab's comprising variable chain heavy regions (VH), which bind to HIV gp120. The Fab's 3b1, 3b2, 3b4 and 3b9 have the same amino acid composition as MT4 but have randomised amino acids in the entire CDR1 and in four of the 18 amino acid residues in CDR3. These Fab's are used in the production of a human monoclonal antibody (MAb) which is capable of immunoreacting with, and neutralising HIV. The MAb's are capable of reducing HIV infectivity titre in an in vitro virus infectivity assay by 50% at a concentration of immunotherapy to HIV in a human. They neutralise HIV more effectively than antibodies selected from non-randomised combinatorial libraries
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                09
Synthetic human neutralising monoclonal antibodies to human immunodeficiency virus - used for diagnosis and immuno:therapy of HIV-induced disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    1 LEQSGAEVKKPGASVKVSCQASGYRFSNFTVH#VRQAPGQRFEWMGWINPYNGNKEFSAK

It is used in a novel chimmeric immunotoxin, that comprises an anti-gpl20 antibody, having binding specificity to 3B3(FV) antibody, that is attached by a connector chimmeric immunotoxin is used in the treatment of HIV-1 infections. It is capable of specifically targeting and killing cells displaying HIV-1 explain the infected cells displaying HIV-1 the HIV viral load in the infected cells. It can also be used in the immunotoxins can also be used for detecting the presence or absence and for quantifying the infected cells

Ten heavy chains which recombined with the bl2 light chain and bound gpl20 by panning were chosen for sequence analysis. AAR54335 was one of these heavy chains. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New human monoclonal antibodies neutralising HIV - react with gp120 or gp41 and nucleic acid encoding them, useful for in vivo or in vitro diagnosis and for passive immuno-therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

The sequences given in AAW01302-11 represent the heavy chain variable regions (VH) of a series of monoclonal antibodies (VAb's) which are immunoreactive with HIV glycoprotein gp120 and are capable of neutralising HIV. This sequence represents the sequence of the geneclone, HC12. These sequences represent heavy chains which bind to the bl12 light chain clone (see also AAW01276). These sequences were isolated from the shuffled heavy chain library, Hn-L12. A WAb containing this VH sequence has the capacity to reduce HIV infectivity titre in an in vivo virus infectivity assay by 50 % at a concentration of less than 700 mg of antibody/ML, and binds mature gp120 preferentially over the precursor gp160. The MAb may be used for determining immunocompetence of a human

This sequence represents a fragment of the antibodies of the invention.

The invention relates to the production of an anti-HIV (human immunodeficiency virus) glycoprotein (gp)-120 monoclonal antibody capable of reducing an HIV infectivity titre in an in vitro virus infectivity comprises. (a) providing a first production of the antibody comprises (a) providing a first polynuclectide encoding a heavy chain immunoglobulin anino acid sequence (which does not comprise the sequence represented by AXY98206) and a sequence, (b) inserting the first and second polynuclectide sequences into a host cell; (c) maintaining the host cell in conditions which allow the host cell; (d) maintaining the host cell in conditions which allow in the host cell; and (d) isolating the minolectides to be expressed in the host cell, and (d) isolating the antibody comprising the heavy and light chain immunoglobulin amino acid sequences from the host cell. The anti-HIV gp-120 monocolnal antibody is used for providing passive immunotherapy to HIV in a human. They can be administered to high-risk patients to reduce the likelihood and/or severity of HIV-induced disease
                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         120
anti-HIV antibody and in the detection of HIV infection. The heavy chain clones designated H2 and H14 exhibited approx. 40 % neutralisation of HIV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              9

and to patients who are already HIV-infected. The antibodies are used for immunocompetence of an immune response in HIV patients, for detecting HIV in a biological fluid or tissue sample e.g. by radioimmunoassay, for producing anti-idiotypic antibodies which can be used for active immunisation and to screen human monoclonal antibodies to identify those with the same binding specificity and to monitor the course of HIV disease therapy by measuring the changes in concentration of HIV present in the body or in body fluids by immunoassay. The anti-HIV gp-120 monoclonal antibodies are encoded by a human polymucleotide sequence and when used in vivo for diagnosis and immunotherapy of HIV induced disease reduce the problems of significant host immune response to the antibodies associated with monoclonal antibodies of xenogeneic or chimeric
